Introduction to the Bedrock Geology of Cerro Gordo County, Iowa

The map area is located in the southwestern part of the state, near the intersection of the Mississippi River and the Mississippi/Iowa state line. The area is characterized by a variety of bedrock geology, including sedimentary rocks, volcanic rocks, and intrusive igneous rocks. The map area is dominated by the Mississippi River, which flows through the center of the area. The region is also characterized by a network of tributaries, including the Iowa River, which flows through the eastern part of the area. The map area is a key part of the Mississippi River basin, and the geology of the area is important for understanding the formation and evolution of the river system.

The map is divided into two main sections: A-B and C-D. Section A-B covers the western part of the area, while Section C-D covers the eastern part. The map includes a legend and key features, such as the Mississippi River, the Iowa River, and a variety of bedrock geology, including sedimentary rocks, volcanic rocks, and intrusive igneous rocks.

The map is designed to help students and researchers understand the geology of the area, and it includes a variety of data layers, such as bedrock geology, soil survey information, and topography. The map is a valuable tool for understanding the geology of the area and for planning future research and development projects.
