A GRAVITY INTERPRETATION OF  
BLACKHAWK COUNTY, IOWA

by

Donald P. Heitzman

ABSTRACT

A ground gravity survey of Blackhawk County, Iowa was conducted in the summer of 1971 in order to obtain more information regarding the Iowa basement complex. Blackhawk County lies on the eastern flank of the Mid-continent Gravity High and was found to contain a very steep gradient of 67 milligals. A close similarity between the Bouguer gravity and aeromagnetic maps lead to the interpretation of five anomalous features as well as several major fault structures.

## INTRODUCTION

The Iowa basement complex is rapidly becoming of major interest due to its association with the Midcontinent Gravity High. Since well data is extremely sparse, geophysical techniques emerge as the most economic alternative in the delineation of the basement structures. Petroleum-bearing structures, structures for the storage of natural gas, and the potential for future mining facilities provide the incentives for these studies.

The objective of the survey was to combine gravitational and aeromagnetic data to delineate the structures in the basement complex of Blackhawk County. The base station used as the primary base station to tie the survey was part of the Iowa gravity base station network of the Iowa Geological Survey, and was located at the Waterloo Municipal Airport. The observed gravity at the station was given as 980.302465 gals (Hase, Cambell, and Van Eck, 1969).

The instrument used in the survey was a Worden gravity meter made available through the courtesy of Orville J. Van Eck, Assistant State Geologist, Iowa Geological Survey. The gravity reduction program GRAVAS was set up by Dan J. Gockel, United States Geological Survey, Iowa City, Iowa, to run on the University of Iowa's IBM 360/65 computer. I am also indebted to Dr. Kenneth F. Clark, associate professor, Department of Geology, University of Iowa; the Department of Geology, University of Iowa, for supplementing

computer time; and the Society of Sigma Xi, for a Grant-in-Aid of research.

#### INSTRUMENTATION AND SURVEY METHOD

The gravity measurements were made with the Worden gravity meter #751 during the summer of 1971 in Blackhawk County Iowa (Fig. 1). Approximately 3,500 obsevations were made and recorded at 598 stations. The traverses began and ended on pre-established secondary base stations which <sup>were</sup> tied to the primary base station at the Waterloo Municipal Airport. The station spacing of the 30 traverses were at mile intervals and taken along county road intersections wherever possible. Each station was marked with a

wooden florescent stake, and a 100% return was conducted on every traverse.

Approximately half of the station elevations used in the raw gravity reductions were taken from topographic maps. The remaining were obtained via an altimeter survey. It is believed that all stations are known within three to five feet, although anomalous errors may be present.

The raw field data was reduced by the computer program GRAVAS obtained from the Iowa Geological Survey. The program was written in FORTRAN and designed to reduce land gravity meter observations to corrected observed gravity, free air and simple Bouguer anomaly values (Army Map Service, 1967). The program was run on the University of Iowa's IBM 360/65 computer.

The following twelve cross sections and profiles were taken at various points of the Bouguer gravity map to demonstrate the relationships between the gravitational and aeromagnetic data. The first nine cross sections contain the five gravity positive anomalies and their structural relationships with the clastic basins and the en echelon configuration of the basement. The last three profiles demonstrate the basement fault complex, and confirms the en echelon pattern. The five anomalies were subjected to calculations fitting density contrasts to the known effect in milligals (Table I). The Cedar Falls West anomaly and the La Porte City East anomaly were

postulated as syenite or diorite intrusives with the older Precambrian basement as the host rock. The Cedar Falls South anomaly, the Waterloo anomaly, and the Gilbertville anomaly all were postulated as granite-like intrusives into Keweenawan clastics.

#### RESULTS

The results of the survey can be summarized as follows:

1. The Blackhawk County Bouguer gravity map was found to have a very steep gradient of 67 milligals, ranging from -66 in the northwest to +1 in the southeast. This confirms the suggested basement configurations on the east side of the Midcontinent Gravity High by the basement map of the United States (A.A.P.G., The Tectonic Map of the U.S., 1968). The gravity high in the southeast corner of the county supports the postulated presence of Keweenawan igneous rocks in this area.
2. It was shown that there was a striking similarity between the Bouguer gravity map and the aeromagnetic map of Blackhawk County. The linear features and anomalies all appeared in the same relative locations and along the same trends.
3. The Bouguer gravity map depicts five positive anomalies trending in a linear northwest-southeast pattern. These

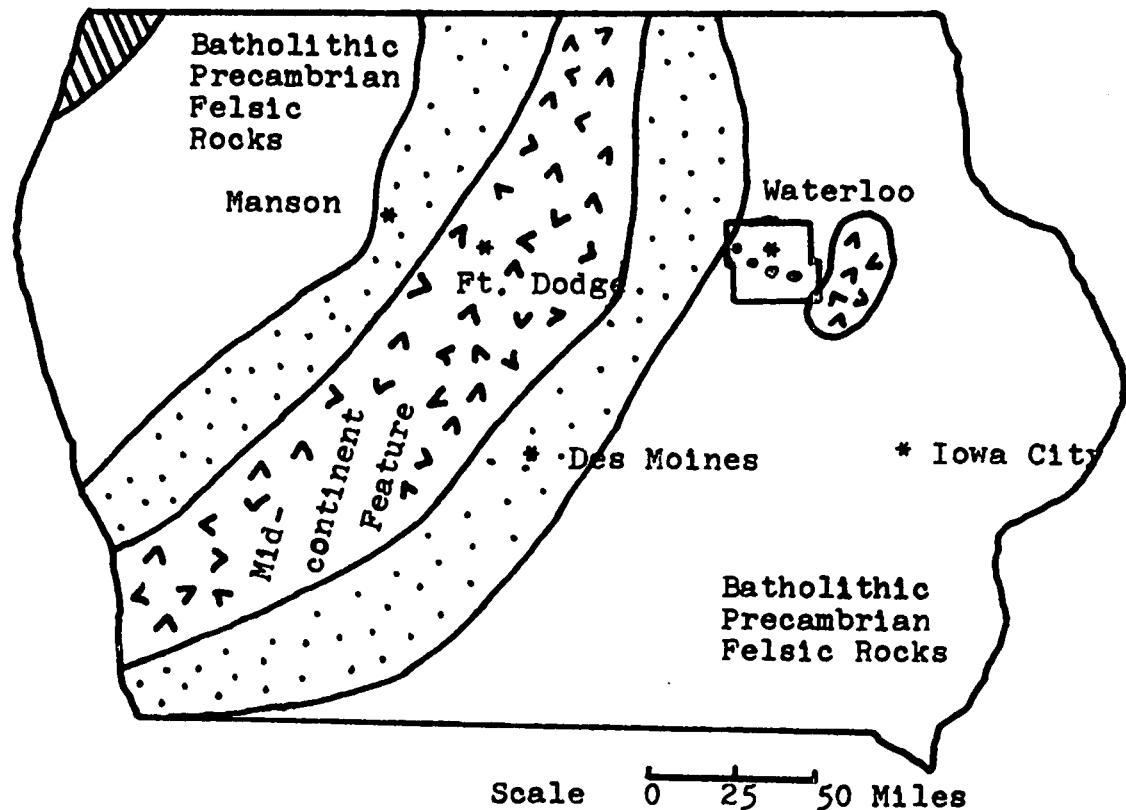

Table I. Compilation of fitted density contrasts to the known gravitational effect together with a postulated source which produces the anomalies.

ANOMALY	CALCULATED DENSITY CONTRAST	RESULTING EFFECT milligals	KNOWN	POSTULATED INTRUSIVE	POSTULATED HOST ROCK
			EFFECT milligals	milligals	
Cedar Falls West	0.20	7.1	7	syenite; diorite	older basement
Cedar Falls South	0.38	15.0	15	granite-like	clastics
Waterloo	0.30	8.0	8	granite-like	clastics
Gilbertville	0.35	8.0	8	granite-like	clastics
La Porte City East	0.25 0.08	6.0 2.0	6 2	syenite; diorite	older basement

Note: The resulting and known effect of the La Porte City East anomaly was taken from the Bouguer gravity map (Pl.III) and the profiles, the first value being from the Bouguer map and the second value from the profiles.

anomalies are suggested as intrusive bodies due to shape, closure patterns, associations with faulted terrane, calculated contrast and corresponding theoretical gravity profiles. These intrusives may be correlatable in part with the Iowa Plutonic Complex of Lidiak (Lidiak, 1966).

4. The linear features are suggestive of faulted areas, and are arranged in a basement en echelon configuration.
5. Basins of Keweenawan clastics were depicted by gravity and magnetic profiles and determined to overlie the intrusives. In general, the basins tended to flank the eastern margins of the intrusives.
6. All five anomalies retained their identity when subjected to a trend-surface analysis which regressed to the sixth order. The Gilbertville anomaly became the most outstanding of all the anomalies in terms of shape, magnitude and location throughout the six regressions.
7. The three faults postulated by Aero Service Inc. from their aeromagnetic data were also depicted from the gravity profiles. A major fault trending northeast-southwest was determined to extend approximately an additional seven miles to the southwest towards Hudson. In addition, smaller faults were depicted by the gravity data in areas of strong linear features on the Bouguer gravity map and provided a better understanding of the en echelon pattern of the basement.
8. Figure 14 summarizes the regional basement geologic relations which became evident from previous geologic literature and the results of this survey.

- Keweenawan clastics (gravity low of King and Zeitz flanking midcontinent high).
- Keweenawan igneous of midcontinent high.
- Souix Quartzite formation.
- Older Precambrian (including Iowa plutonic complex of Lidiak, 1966 of probable Elsonian age (1460-1280 m.y.)).

Figure 4. Regional basement geologic relations in Iowa confirmed by gravity study of Blackhawk County (modified from King and Zeitz (1971), King (1969), Lidiak (1966), and Basement Map of United States (1968)). Local anomalies overlain by Keweenawan clastics are indicated diagrammatically.

## CONCLUSIONS

More information concerning the Iowa basement complex has been uncovered via geophysical techniques. Previous unknown and/or unconfirmed structures have now been confirmed and located such that they may be studied in detail by any interested party for evaluation of future economic potential.
